Performance of Concrete and Market Share

John S. Dick, Executive Editor

As ASPIRE™ concludes its second year of exploring sustainable solutions, this issue’s PERSPECTIVE by Clifford L. Freyermuth offers a challenge to the nation’s bridge officials. In it, he addresses the growing durability of bridges and suggests that the American Association of State Highway and Transportation Officials (AASHTO) and the Federal Highway Administration (FHWA) begin work to require from 100- to 150-year service lives for highway bridges. Such a goal is noteworthy—and achievable.

Cliff’s career has spanned nearly 55 years. His direct involvement in bridges began with the Arizona State Highway Department in 1958. From there on, it was all concrete when, in 1964, he joined the Portland Cement Association. Then, in 1971, he directed post-tensioning activities for the Prestressed Concrete Institute before founding and managing the Post-Tensioning Institute in 1976. In 1989, he helped establish and then managed the American Segmental Bridge Institute through 2008.

He has been instrumental in dealing with many durability and constructability issues that have challenged the prestressed concrete industry since the 1960s. With his unique background, he proposes ways to extend the service life of bridges and advocates the incorporation of minimum service life provisions in the LRFD Specifications. His perspective begins on page 12.

Concrete bridges have an enviable performance record. In the United States, statistics on the condition of bridges are kept in the National Bridge Inventory (NBI) maintained by the FHWA. Generally, high-performance concrete for bridges has been widely adopted over the past two decades. As a result, concrete bridges will perform increasingly well in all likelihood, surpassing expectations. Past performance and suggestions for the future are presented in the Perspective feature mentioned above. Another way to measure performance is through the confidence shown by those designing bridges in the materials they select. The percentage of bridges being built of concrete continues to increase.

Each year, the FHWA compiles data from the NBI (http://www.fhwa.dot.gov/bridge/nbi/matreport2008.cfm). They publish the quantity and deck areas of all bridges built in a given year, by the material of their superstructures. The data are broken down also by federal and non-federal aid highways and are reported by state. Since it takes nearly 2 years for the NBI to receive data for all new bridges built, the latest complete data released this July was for 2006. The data of interest here are for new and replaced bridges. Rehabilitated bridges are not considered.

For the three most recent years, 2004, 2005, and 2006, the percentages of the nation’s bridges built using concrete, based on the numbers of projects was 75.8, 76.2, and 75.4, respectively. The balance, of course, is of other materials.

Although the percentage of bridges has remained relatively constant, it appears the size of bridge projects using concrete is growing larger, based on the deck areas of bridges built. For concrete, the percentages for the same years are 67.5, 65.5, and 69.3; a dip then significant growth.

One may also look at the share of bridges built of prestressed concrete. This includes precast, prestressed concrete and all means of prestressing concrete on site such as cast-in-place post-tensioned concrete and all types of segmental concrete construction. The percentages of prestressed concrete bridges built in the past 3 years are by numbers of projects—39.4, 42.5, and 42.9; and by the areas of bridges built—54.8, 55.0, and 60.2. At the same time, in 2006, the number of mildly reinforced concrete bridges exceeded 32% of the total built.

These numbers also likely are understated. A bridge’s material in the NBI is determined by the material of the main span. A considerable number of bridges are built with a main span of steel and concrete approach spans. Accounting for these additional areas of concrete construction would most certainly add share for concrete.

Each day, innovative new solutions are being implemented. In this issue, five such projects are featured; each one employs sustainable design concepts. Each project offers ideas to meet a range of challenges. Consider the 24,000 psi compressive strength concrete (Continued on page 4)

Colorado’s Longest Concrete Bridge Span

4th Street Bridge, Pueblo, Colorado

Construction of Colorado’s longest concrete highway span at 378’ with twin 1,137’ long bridges is scheduled for completion in Spring 2011.

This sustainable, environmentally friendly bridge is being built in concrete segmental, balanced cantilever construction over 28 active rail tracks in the Pueblo Rail Yard and the Arkansas River. The canal wall of the Arkansas River is the world’s longest painted mural featuring local artistic expression.

Aesthetics were developed through the FIGG Bridge Design Charette™ process with community members selecting features of the bridge. Participants selected bridge features that blend the timeless lines of Contemporary Sculpture with the Natural River Environment and the stylistic aspects of Pueblo Heritage.
Editor, I received today the Summer 2009 issue of ASPIRE. I immediately glanced through it. Great issue. The quality and value of the magazine is outstanding. You find new ways to improve upon perfection. Congratulations to [the ASPIRE team].

I enjoyed thoroughly reading several of the articles. Because of my interest in the condition of the nation’s bridges, I paid particular attention to the Perspective article by Andrew Herrmann. When I reached the end of the second page I could not find the continuation of the sentence on the next page! What am I missing?

Basile Rabbat
Portland Cement Association
Skokie, Ill.

[Editor’s Note: Dr. Rabbat was not the only one to spot our error. During layout, the final four words of the article were hidden under the graphic that follows the last sentence. Those words were “in the long run,” so the last sentence provides wise advice and should have read, “However, if we do not invest now, we will end up paying more in the long run.” Our sincere apologies to author Andrew Herrmann!]

Extraordinary People, Performance, and Projects

As a global leader in program management, engineering, and construction, CH2M HILL partners with clients and communities to deliver the facilities and infrastructure that grow economies and enhance quality of life.

• Optimize your facilities and infrastructure to increase efficiencies and reduce life-cycle costs
• Apply technology to create solutions that improve your competitive position
• Partner with you to deliver your most challenging projects
• Remain committed to sustainable economic development and environmental stewardship

These objectives led CH2M HILL to become the forward-thinking group of more than 25,000 professionals that we are today, dedicated to helping clients overcome limitations and achieve that better world.
