Forging a New Generation of Sustainable Bridges

John S. Dick, Executive Editor

With this issue, ASPIRE™ begins its third year of delivering information on outstanding bridges, imaginative solutions, and solid, useful techniques for the bridge design and construction community. We appreciate your encouragement and support and we certainly welcome your comments and suggestions.

Sustainability to Remain Focus

Sustainable bridge design will again be our focus in 2009. We introduced and explored it in 2008 and it became the obvious choice for 2009. We discovered that nearly every featured bridge last year had sustainability considerations woven into its design. It became clear that concrete bridges are truly the sustainable solution for our nation’s bridges. Every attribute we ascribe to concrete bridges meshes with principles of sustainability. So, we will continue to report your accomplishments and we will emphasize those aspects whenever techniques stand out.

Challenges Prevail

As we go to press, the state of the nation’s economy is on every mind. In transportation, long-term funding solutions are likely to be a high priority in 2009. Solutions and various economic stimulus ideas have become the topics du jour.

Project Features

This issue’s project reports include three highway bridges, a pedestrian bridge, and a major airport taxiway bridge. Included in the mix is the longest span concrete box girder bridge in the United States, the Kanawha River Bridge, on page 30. A unique pedestrian bridge in Washington State incorporates numerous aesthetic features and required construction over busy I-405 (see page 26). The Port Columbus Taxiway Bridge is designed for Group V aircraft loading while achieving a slender and attractive solution (see page 34). As you can see, there are many applications for concrete bridges.

Industry Advisory

The Safety and Serviceability feature in this issue is an advisory developed by the Precast/Prestressed Concrete Institute (PCI). After experiencing a number of situations involving “sweep” of long slender girders, the industry identified circumstances that could lead to undesirable performance. This discussion begins on page 38.

New Special Section

On page 41, ASPIRE begins a new regular feature we call Maintenance, Repair, and Rehabilitation of Concrete Bridges. Until now, we have not explored these subjects, but believe they are critical issues enabling bridge owners and designers to strengthen and prolong their concrete bridge inventories. We look forward to your comments and especially ask for your ideas about projects that deserve recognition. Let us know!
